

Property Rental & Management System

Project Objective

Build a Django-based **Property Rental & Management System** where property owners can list their properties for rent, and tenants can search for properties and send rental requests.

The project should demonstrate your understanding of **Django CRUD, Forms, Templates, Authentication, Middleware, Relationships, and User Permissions**.

1. User Authentication

Implement a complete authentication system.

Users should be able to:

- Register
- Login
- Logout
- Update their profile

The system should have two user roles:

Property Owner

- Add properties
- Edit their own properties
- Delete their own properties
- View rental requests
- Accept or reject rental requests

Tenant

- Browse properties
 - View property details
 - Send rental requests
 - View their requests
 - Cancel pending requests
-

2. Property Management

Property owners should be able to create and manage property listings.

Each property should contain:

- Property title
- Description
- Property type
- Location
- Monthly rent
- Number of bedrooms
- Number of bathrooms
- Property image
- Availability status
- Owner

Implement full **CRUD operations** for properties.

A user must not be able to edit or delete another owner's property.

3. Property Listing & Search

Create a property listing page where users can see available properties.

Users should be able to:

- Search properties by location
- Filter by property type
- Filter by minimum/maximum rent
- View property details

Example property types:

- Apartment
 - House
 - Room
 - Office
-

4. Rental Request System

A tenant can send a rental request for an available property.

A rental request should contain:

- Property
- Tenant
- Message
- Request date
- Status

Request status:

Pending → Accepted / Rejected

A tenant should also be able to cancel a **Pending** request.

Important Rules

- Only logged-in users can send rental requests.
 - A tenant cannot request their own property.
 - Only the property owner can accept or reject a request.
 - A tenant cannot send multiple pending requests for the same property.
-

5. Owner Dashboard

Create a simple dashboard for property owners.

It should show:

- Total properties
- Available properties
- Total rental requests
- Pending requests
- Accepted requests

The owner should also be able to manage their properties and rental requests from the dashboard.

6. Tenant Dashboard

Create a dashboard for tenants.

It should show:

- Total rental requests
- Pending requests
- Accepted requests
- Rejected requests

Tenants should be able to view their request details and cancel pending requests.

7. Reviews & Ratings

After a rental request is accepted, the tenant can leave a review.

A review should contain:

- Rating from 1–5
- Comment
- Property
- Tenant

Display reviews on the property details page.

A tenant can review a property **only once**.

8. Django Admin

Configure Django Admin to manage:

- Users
- Properties
- Rental Requests
- Reviews

The admin should be properly organized and usable.

9. Technical Requirements

Your project must use:

- Django
- Django Templates
- Models
- Model Relationships
- Forms / ModelForms
- CRUD Operations
- Authentication
- Authorization / Permissions
- Middleware
- Image Upload
- Search & Filtering
- Form Validation
- Django Admin

You may use **Bootstrap** or another CSS framework for the UI.

Bonus Features

These are optional:

- Email notification for rental requests
 - Favorite properties
 - Pagination
 - Property image gallery
 - Map/location integration
 - REST API using Django REST Framework
-

Submission Guidelines

Submit your project through **GitHub**.

GitHub Repository

Your repository should contain:

- Complete Django project
- `requirements.txt`
- `README.md`
- Migration files

- `.gitignore`

Do Not Upload

- `.env` files
- API keys
- Passwords
- Secret keys
